Ryan : Create input control panel

△ dfa_input_panel.tscn

△ DFA Input Panel [Panel Container]

△ [VBox Container]

△ Instructions [Label] — • Instructions: "Press Ø or 1 to advance one transition!"

△ Buttons [HBox Container]

△ Input Ø Button [Button] — • text: "Ø"

△ Input 1 Button [Button] — • text: "1"

△ Reset Button [Button] — • text: "Reset"

△ Current State Label [Label]

△ Accept Label [Label]

○ dfa_input_panel.gd

- • emit `signal input_requested(symbol: String)`, where "Ø" or "1" correspond to button presses
- • Emit `signal reset_requested()` when reset button pressed
- • `func show_status(state_name: String, accepting: bool) → void`
  - • modifies current state & accept labels
- • The panel does not reference Automata or change DFA data.
- • Signals will be connected elsewhere
- • Method called elsewhere

Ryan: Remove input from table

○ Edit transition_table_gui.gd

- • Change generated transition nodes from line edit to label

Ryan: Test control panel in new scene

△ test_dfa_input_panel.tscn
- △ DFA Input Panel [Scene]
- △ Test Show_B_Pass [Button]

○ test_dfa_input_panel.gd
- • `func enter_tree()`
  - • Connect to DFA panel signals
  - • Call `Show_status("A", false)`
  - • Connect test button click to call `Show_status("B", true)`

Laney: Simplify State Visual

△ State_2d.tscn
- △ OuterCircle2D [DrawCircle2D]
- △ AcceptRing2D [DrawCircle2D]
- △ NameLabel [Label]
- △ StartLabel [Label]
- △ CurrentLabel [label]

○ State_2d.gd
- • `func ready()`
  - • Set label nodes based on matching variables (label_name, is_start, is_accepting).
- • StartLabel visible only when `is_start` true
- • AcceptRing2D visible only when `is_accepting` true
- • write `func set_current(value: bool) → void`
  - • Show/hide CurrentLabel
- • Remove existing condition enum & signal

Laney: Test state 2D

△ test_state_display.tscn
- Node2D
  - State A [state_2d] — start & accept
  - State B [state_2d]
  - State C [state_2d] — accept

○ test_state_display.gd
- call `set_current(true)` on A
- call `set_current(false)` on A
- call `set_current(true)` on B

Laney: Demo DFA

- Create a TTableRes resource with inputs ["0", "1"], start: "A", and accepts ["A"].
- Create markdown table in project containing input sequences & expected results.

input	final state	accepting
""	A	Yes
"0"	A	Yes
"1"	A	Yes
"11"	A	Yes
"101"	A	Yes
